Russia's Enteromix Cancer Vaccine Shows 100% Efficacy, Poised for Approval

Russia's mRNA-based cancer vaccine, **Enteromix**, has demonstrated **100% efficacy and safety** in early trials, specifically targeting **colorectal cancer**. Developed using precision mRNA technology, the vaccine triggered strong tumor-fighting responses in preclinical and early clinical studies, earning a major breakthrough in cancer therapeutics. Reported by TASS and covered in global media, Russia is now moving toward regulatory approval, pending further trials and scrutiny. If validated, Enteromix could revolutionize the fight against cancer with its potential to prevent and treat one of the most lethal cancers worldwide.
